目录 content

01 介绍

02 LORA的简要技术背景

03 LORA网络的现有部署

04 研究问题的分类

05 当前解决方案

06 未决问题

07 结论

01

介绍

INTRODUCTION

止于至善

Internet-of-Things

IoT

Robust Operations

Humidity
Temperature

Wider Coverage

Large Geographical Area

High Energy Efficiency

Mostly Battery Powered

Conventional Technologies

Zigbee
Bluetooth
Shorter Range

LPWAN Technologies

Cellular-IoT Technology

Based on Cellular Infrastructure

Lora Networking

Autonomous
Without Third-Party Infrastructure

Proprietary Networks

Autonomous
With Third-Party Infrastructure

Cellular-IoT Technology

Advantages

Wide Area

Densely Populated

Higher QoS

Disadvantages

Energy Inefficiency

Heavy Interference

Types

LTE-M

NB-IoT

EC-GSM

Proprietary Networks

Advantages

Link Budget
Coverage
Vendors Traction

Disadvantages

Closed Source
Low Security
Downlink Restriction

Types

SigFox
Ingenu
Weightless

Lora Networking

Advantages

Open Source

Over the Air Update

Low Cost

Immune to Interference

Higher Payload

**Encryption and
Authentication**

Smart Buildings

Smart Cities

Smart Agriculture

Differences

Devise a Taxonomy for Problems

Upper Layers Discussed

Recent Performance Measurements

Recent Technical Advancements

Further Improve Performance

Challenges

Recent Solutions

Open Issues

02

LORA的简要技术背景

TECHNICAL BACKGROUND

止于至善

LoRa Stack

Sub-GHz ISM Band

LoRa

Physical Layer :

Chirp Spread Spectrum

LoRaWAN

MAC Layer :

ALOHA : Exponential Back-Off

TDMA : Time-Slot

Chirp Spread Spectrum

Frequency Varies Linearly within the Available Bandwidth

Spreading Factor

Time on Air
Number of Data Bits

Bandwidth

Data Rate

Code Rate

Resilience to Noise

LoRa System Architecture

End Devices

Three Operating
Modes

Beacon

LoRa

Gateways

Forwarders
Relay Message

Application Servers

Process Messages

TCP/IP

Network Servers

Make Decisions
Direct Message

ACK (RW)

TCP/IP

Unique Properties

Ultra-Long Distance

Line-Of-Sight Communication

SF、TP、CR、PRR

Long Lifetime of Nodes

Duty Cycle

Low Cost and Complexity Device

Channel Activity Detection

Reduce Overheads : No Signalling

Concurrent Reception of Gateways

Orthogonal SF

Robustness to Doppler Effect

Doppler Effect

03

LORA网络的现有部署

EXISTING DEPLOYMENTS

止于至善

EXISTING DEPLOYMENTS

Smart Cities and Urban Deployments

Waste Management

Monitor Solar Power Plants (Legacy)

Power Monitoring

Smart Meters

Smart Metering Applications

Smart Golf Course

Sensor of Golf Cart

Smart Islands

Reports Water Quality

04

研究问题的分类

TAXONOMY

止于至善

Energy Consumption

Energy Efficiency

Improve the Longevity of End-Devices
Unavoidable Circumstances

End-Device Operations

Micro-Controller Operations
Wireless Transmissions

Techniques

Consume Instantaneous Bandwidth
Light MAC Protocols

Communication Range

Technology

Rudiment

Chirps Spread Spectrum

Challenge

Signal Attenuation

Propagation Losses and Fading

Gateways Decode Signals

Estimating the Coverage

Anisotropic

Unexplored Mathematical Models

Multiple Access

Aim

Confined Region and Spectrum
Share Limited Spectrum Concurrently

Link Coordination

Scheduler : **ALOHA / TDMA**
(Cannot Handle Collisions)

Resource Allocation

Vary Parameters
Dynamic Deployed Environment

Error Correction

Existing Schemes

Hamming Code
Spreading Factors
(Data Corruption)

Channel Coding

DaRe : Application Layer
Redundant Data
(Bursty Packet Loss)

Interference Cancellation

Extract Collided Signals
(Inadequate Number)

Security

Security Key Attacks

Eavesdropping
Selective Forwarding
Node Impersonation

Current Key Technology

AES-128 Bit Encryption
Never Update Key

Requirements

Key Generation
Key Update Mechanism
Third-Party Authorization

05

当前解决方案

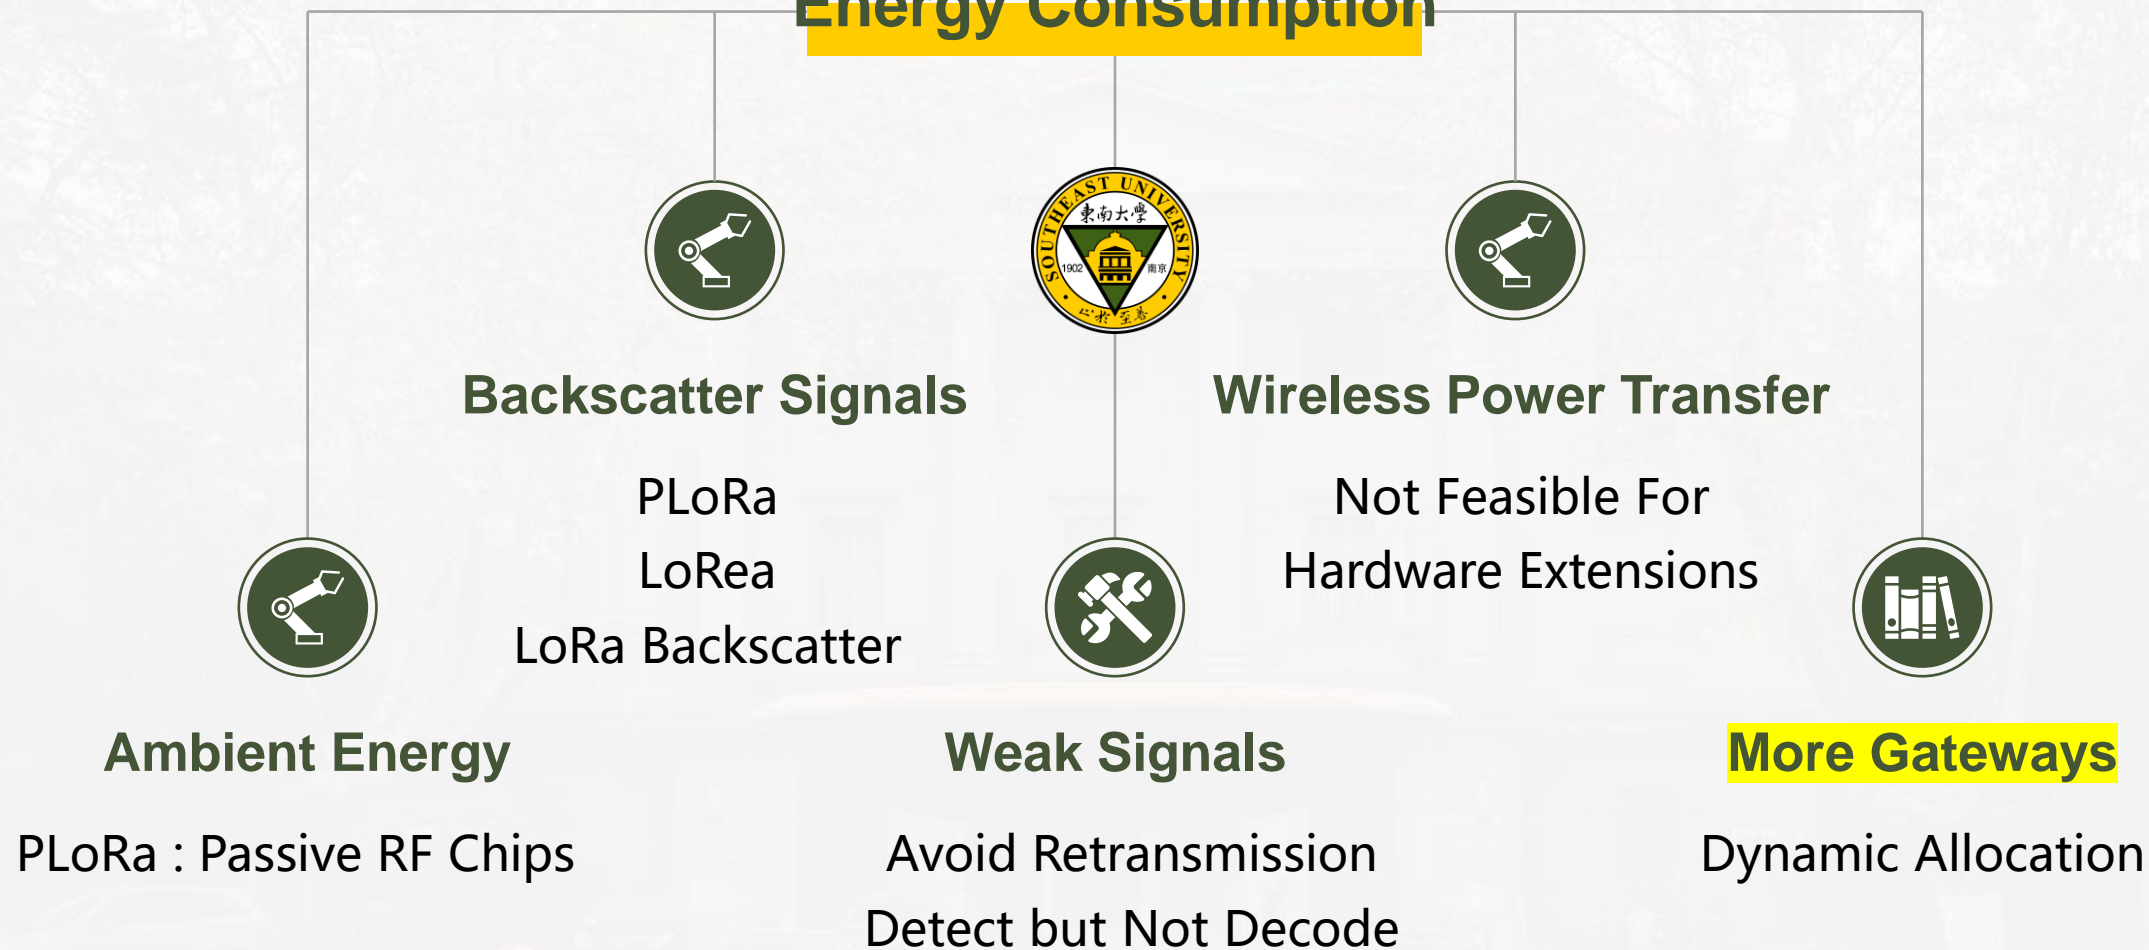

CURRENT SOLUTIONS

止于至善

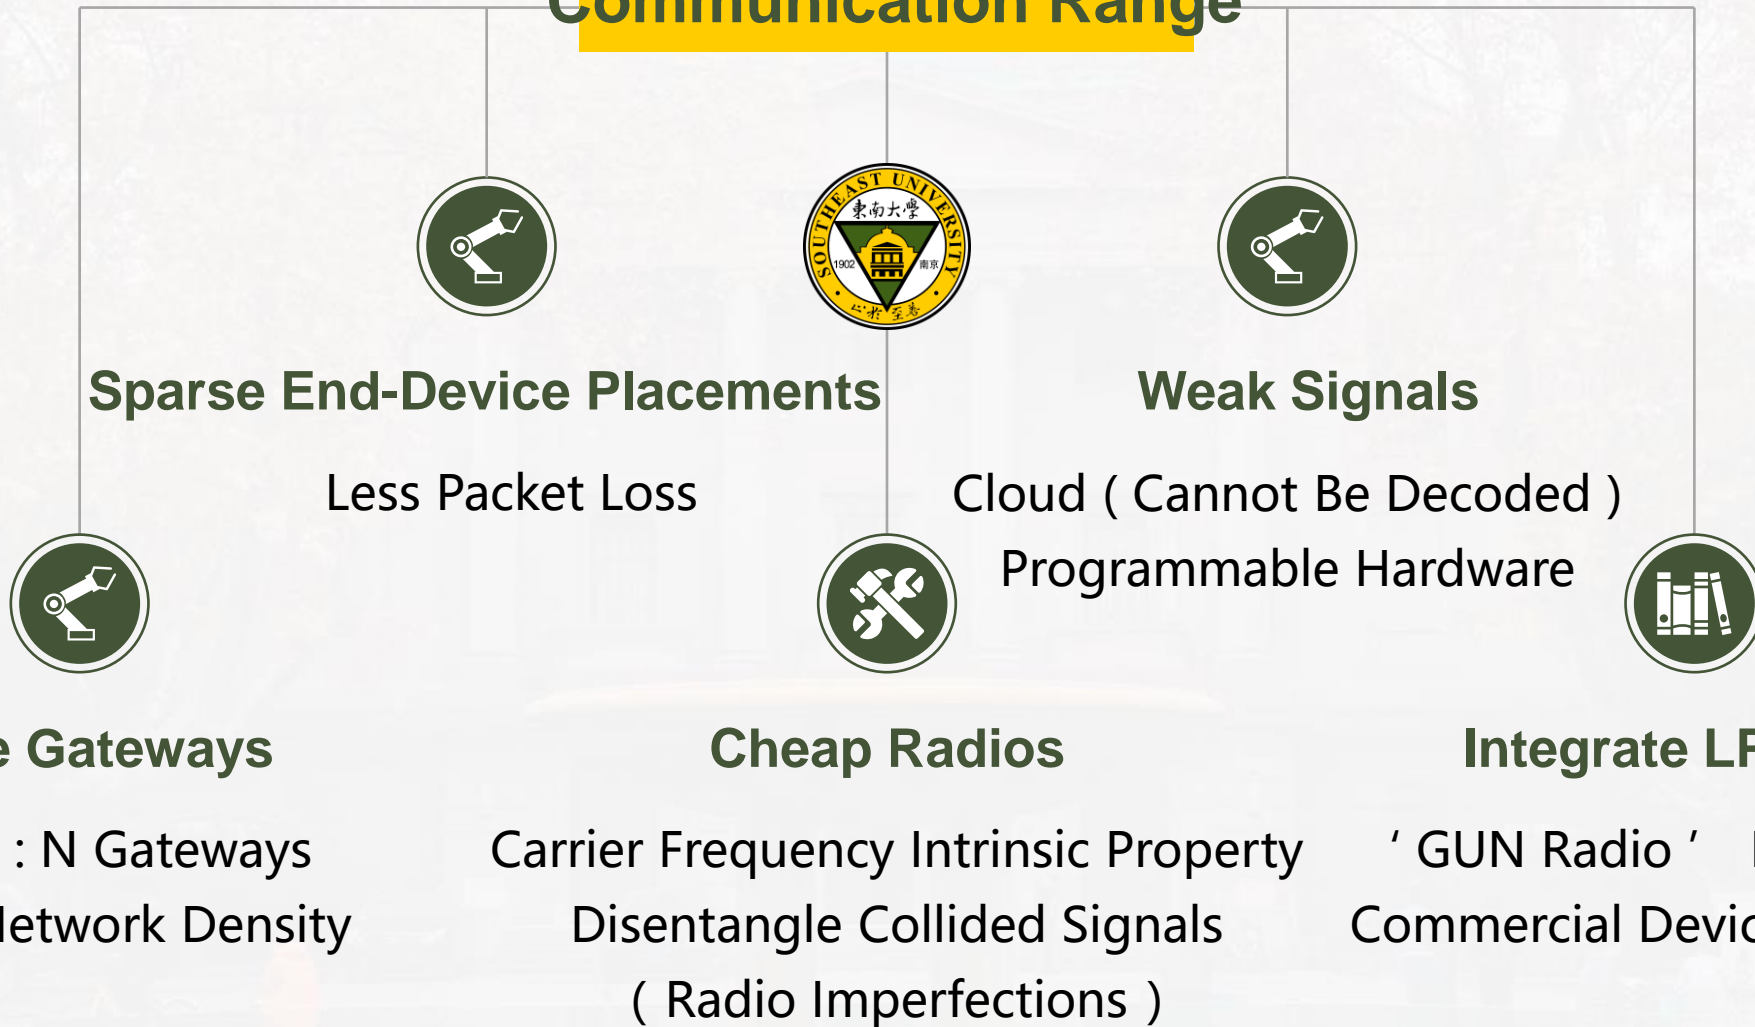

Energy Consumption

Communication Range

Error Correction

Channel Coding

Drake : Redundant Information
(Difficulty to Create Degree of Distribution)
(Increase Number of Collision)

Interference Cancellation

Carrier Frequency Intrinsic Property
Disentangle Collided Signals
(Only 5-10 Devices Concurrently)
Distributed Error Correction Tech Proposed

Additional Preambles

Ideal-CSMA : Low PRR (Synchronously)

CSMA-CAD : SF Randomized, PRR Doubled

RS-LoRa

Coarse-Grained Information
Parameter Combination
Network Density

Retransmission Scheme

Theoretically Proven
Data Compression
Channel Coding

Multiple Access

Link Coordination

Network Density

More Gateways (Directional Antennae)

Assign Dynamic Parameter

ADR

Performance

Deployed Environment

Genetic Algorithm

Usage of ACKs

Adaptive Data Rate

Data Rate

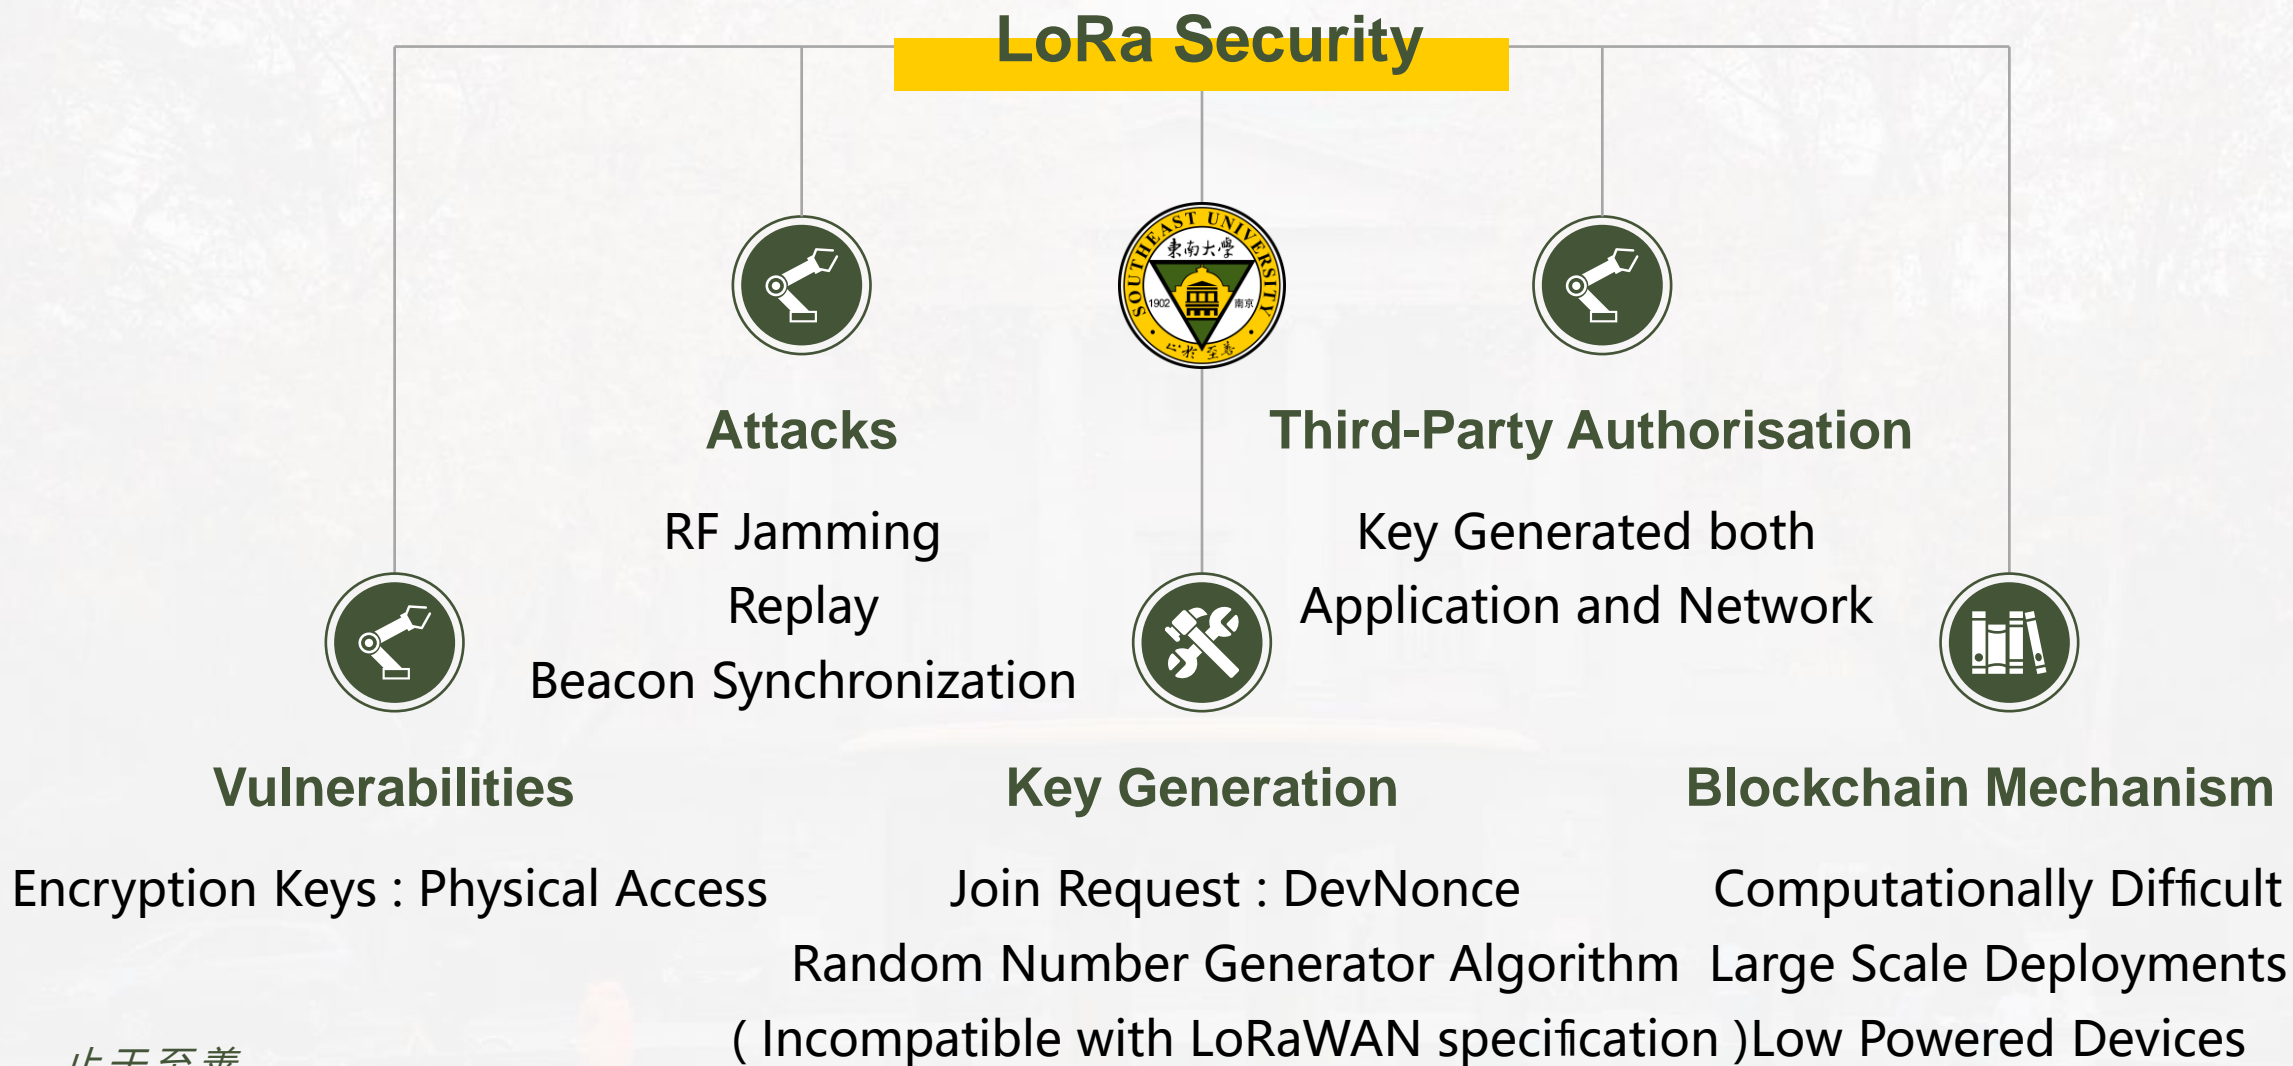

Channel Allocation

Energy Consumption

Multiple Access

Resource Allocation

06

未决问题

OPEN ISSUES

止于至善

Placement of Gateways Link Co-ordination

Categories of Applications

Dynamic Retransmission Policies

(Downlink ACK)

Communication Range Security

LoRa Chips Evolve

Each Deploying Applications

Light Modifications of Chips

07

结论

CONCLUSION

止于至善

Structure

感谢老师

Thanks For Listening
